

1. Do a detailed research about the soil of kepler-1649c, since it is in habitable zone and it may have very good probability of containing water and minerals in it.
2. The first and foremost step is to setup the devices according to the atmosphere of the planet and also the road facilities .
3. Since it is orbits around a red dwarf , it does get more amount of light because red dwarf luminesces only a very less light ( $1/10000$  of our sun),but there is a positive point also i.e., Kepler 1649c is near to the red dwarf (9.7M Km). So it gets a very huge amt of radiation.
4. We will use this radiation as power source for the vehicles and all vehicles will be automated to maintain the zero causality of accidents
5. Also the public transport over there would also be automated that would move in a line with very high speeds and stop in the station of every 5 min

6. The vehicles are made such that the windows and over all material is capable of absorbing the radiations coming in and converting them into energy source
